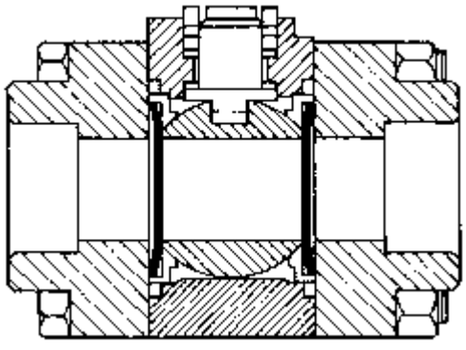
- Disc springs acc. to DIN 2093 are mostly used in critical applications with safety first. Similar applications can be found in for example safety torque limiter clutches, hinge stiffeners and applications of constant roll pressure. Because of the right combination c.q. stacking of the disc springs the elasticity and/or deflection can be dosed accurately. The technical specifications of the disc springs above meet the highest expectations with reference to the static and dynamic load. They exceed the requirements of DIN 2093.
- Material group 1: t < 1,25 from steel Ck 75.
- Material group 2: 1,25 ≤ t ≤ 6,0 from steel 50 Cr V4 (fatique fractures can be largely prevented because these disc springs have machined edges).
- F = spring force in Newton at a deflection s ≈ 0,75 h_o ($h_o = L_o - t$).
- Nominal thickness. For the calculation of disc springs, see DIN 2092.
- Extensive technical data available on request.

Example of application



Ball valve

36302 Disc spring for critical applications type B (medium) L07C

- The disc springs mentioned above acc. to ≈ DIN 2093 are suitable for general use. For more critical applications it is advised to choose disc springs from the article groups 36300, 36302, 36303 and 36450.
- Group 1: t < 1,25 from steel CS70 acc. to BS 1449-1.
- Group 2: 1,25 ≤ t ≤ 6,0 from steel 50 Cr V4 (edges of these disc springs are not machined).
- F = spring force in Newton at a deflection s ≈ 0,75 h_o (h_o = L_o - t).
- Type A: execution heavy (D_e/t ≈ 18).
- Type B: execution medium (D_e/t ≈ 28).
- Type C: execution light (D_e/t ≈ 40).
- If the type is not mentioned, the concerning dimension is not DIN standardised.
- For the calculation of disc springs, see DIN 2092.

- Disc springs are mostly used in critical applications with safety first. Similar applications can be found in for example safety torque limiter clutches, hinge stiffeners and applications of constant roll pressure. Because of the right combination c.q. stacking of the disc springs the elasticity and/or deflection can be dosed accurately. The technical specifications of these disc springs meet the highest expectations with reference to the static and dynamic load. They exceed the requirements of DIN 2093.
- Material group 1: t < 1,25 from steel Ck 67.
- Material group 2: 1,25 ≤ t ≤ 6,0 from steel 50 Cr V4.
- Material group 3: 6,0 > t ≤ 14,0 from steel 50 Cr V4.
- Fatique fractures can be largely prevented because the disc springs of material group 2 and 3 have machined edges.
- F = spring force in Newton at a deflection s ≈ 0,75 h_o ($h_o = L_o - t$).
- For the calculation of disc springs, see DIN 2092.
- Extensive technical data available on request.

36450 Disc spring for critical applications **L07C**
